

METHOD FOR PROVIDING A SET OF SOFTWARE COMPONENTS

Abstract of the Disclosure

The invention relates to a method for providing a set of software components (201, ..., 206) out of which a software application to be executed by an apparatus (400) comprising processor means and memory means can be partly or entirely assembled.

In order to reduce the memory space for storing said software components in said apparatus it is proposed to assign a different numeric identifier (220, ..., 225) to each component (201, ..., 206) of said set of software components, and to store each assigned numeric identifier (220, ..., 225) in the corresponding component (201, ..., 206).
